An issued record preserves submitted information. It is not a grade or proof of comprehension.

**Personal GitHub repository URL**

https://github.com/anguyen0344/CS-110

**Git test: edit  run/preview  save  commit  push  open remote. Record the test commit and result.**

I edited and saved Week12A/git-test.html in VS Code. I opened it in Chrome and confirmed that the heading appeared. I committed the file, pushed it to my personal CS-110 repository, and verified that the file appeared on GitHub.

Commit: Add Action 12A Git workflow test

Evidence: https://github.com/anguyen0344/CS-110/blob/main/Week12/Week12A/git-test.html

**Instructor access and team Git readiness: what did you test? Solo: say solo.**

I m working solo for Action 12A. I verified that Week12/Week12A/git-test.html is visible in my personal GitHub repository after pushing it.

**1  Introduction  scan notes, one useful idea and one question**

Observation: The video introduces a simple game development pipeline that covers mindset, folder structure, documentation, and tools.

Useful idea: The idea that documentation grows with the project stood out to me. For my solo project, I can start with a short README and update it with how to run the Unity scene and what I tested.

Question: What should I put in my README at the start, and what can I add after I test the game?

**2  Developer mindset  scan notes, one useful idea and one question**

Observation: The video explains that a growth mindset means taking on challenges, learning from mistakes, and being open to feedback.

Useful idea and interpretation: I can use a failed test to decide what to try next. In my solo Unity project, if the beacon doesn t activate when I press E nearby, I can check the interaction range first and test again after changing one thing.

Question: How can I tell whether the issue is with the interaction range or with Unity detecting the E key?

**3  Folders and project creation  scan notes, one useful idea and one question**

Observation: The video shows how to set up a project folder and start a dated log to track work from the beginning.

Useful idea and interpretation: For my solo project, I can keep my notes and screenshots organized in

Week12/Week12A and use a short log to record what I changed and tested. That way, I can pick up where I left off the next time I open the project.

Question: What should I put in my project log, and what should go in my README?

**4 Documentation scan notes, one useful idea and one question**

Observation: The video shows how a one-page game design document can use a diagram and short labels to explain how a game mechanic works.

Useful idea and interpretation: For my solo Unity project, I could sketch the beacon interaction on one page: walk into range, press E, and see the beacon activate. This would help me explain the mechanic and decide what to test.

Question: Should I include what happens when the player presses E outside the beacon s range, or keep the diagram focused on successful activation?

**5 Introduction to Unity scan notes, one useful idea and one question**

Observation: The Hierarchy lists the objects in the scene. When I select an object, the Inspector shows its components and settings. The Scene view is where I edit the scene, and the Game view shows what the player sees.

Useful idea and interpretation: For my solo project, I can select the beacon in the Hierarchy, check its settings in the Inspector, and then use the Game view to test what the player sees when pressing E near it.

Question: If I change the beacon s settings in the Inspector during Play Mode, will those changes still be there when I stop the game?

**6 Import a custom player scan notes, one useful idea and one question**

Observation: The video shows how to import a 3D character model into Unity and explains that a prefab is a reusable template for a GameObject.

Useful idea and interpretation: For my solo Unity project, I could give the Explorer a custom look while keeping its existing movement and beacon interaction. After swapping the model, I would test both behaviors again.

Question: How can I replace the player s model without changing its movement script or collider?

**Your interpretation: what can this pipeline contribute to a prior or new story?**

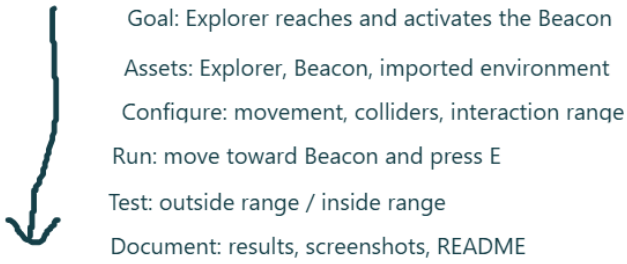
I can use this pipeline to build on my Week 11B story, where the Explorer restores communication by activating a beacon. My goal is to make it clear when communication has been restored. I would reuse my Explorer and Beacon, set up a message in the Game view, and test what happens when I press E both inside and outside the beacon s range. Then I would record the results in my README so I can repeat the test after making changes.

**Questions to resolve before committing to a team or mission**

I m working solo and plan to build on my Week 11B Explorer and Beacon scene.

1. Can I reuse my existing Explorer and Beacon and import a small environment for the Explorer to move through?
2. What should I check after importing the environment to make sure the Explorer can move through it and still activate the beacon?
3. What evidence should I include for Action 12B: screenshots, a short video, or test notes in my README?

## Whiteboard

## CS110 / INDEPENDENCE ROAD


My diagram connects the development pipeline to my solo Explorer and Beacon project. I will organize the assets, configure the scene, and test movement and beacon activation. Pressing E outside the interaction range should not activate the beacon, while pressing E inside the range should activate it. I will record the actual results and screenshots in my README.
