What do you understand about the work and finish line?

My job is to build a small Unity scene where the Explorer can move through an imported environment and reach the Beacon. I will organize the assets, check movement and collisions, and test beacon activation inside and outside its interaction range. The work is complete when the scene runs as intended, the test results are documented, and the project files and evidence are uploaded to my personal GitHub repository.

What will you contribute? Name a task or useful capability.

I m working solo, so I will handle scene setup, importing and organizing environment assets, and testing the Explorer s movement and Beacon interaction. I will also document the results, capture screenshots, and upload my work to my personal GitHub repository.

What needs research, support or practice?

I still need practice importing environment assets into Unity and checking their scale and colliders. I also need to learn how to replace the player s model without breaking movement and how to display the Beacon s activation message in the Game view. I will use tutorials, test one change at a time, and ask the instructor for help if I get stuck.

Your available work times and preferred contact method: Discord, email, text, classroom or other. Keep private addresses/numbers outside public exports.

Preferred contact: Classroom

I m working solo during the CS110 class session. I will use this time to plan my scene, organize assets, and prepare tests. I can ask the instructor questions in class.

List your project tools and why you need them.

I will use Unity to build the scene, import environment assets, and test the Explorer s movement and Beacon interaction. I will use VS Code to edit C# scripts and write README notes. Git will track my changes, and GitHub will store my project and evidence so the instructor can access them. I will use screenshots to document my test results.

Required: name the AI you will use, its project task and how you will verify its output. Use course-provided/shared or approved local access if needed; no personal or paid AI account is required.

AI: ChatGPT

Task: Help me plan my solo Unity project, explain C# code, and suggest troubleshooting steps and test cases for Explorer movement and Beacon interaction.

Verification: I will review and explain any suggested code, test changes in Unity, check the Console for errors, and compare expected and actual results. I will test Beacon interaction both inside and outside its range and document the results.
